

ACTIVATING THE AZURE AD AUTHENTICATION

You can enhance security by activating Azure AD authentication. After the activation, logging on to the CSI software happens via users' Azure AD accounts.

After Azure AD authentication is activated, you can no longer log in with a username/password combination or a domain account - only with an Azure AD account. Therefore, it is vital that all CSI users have a working Azure AD account.

1. Using your organization's Azure AD account, log in to <https://auth.csihelsinki.fi/>
2. Add a new database by selecting New Connection and fill in the information > Create

Signed in Jari.Loiri@csihelsinki.fi

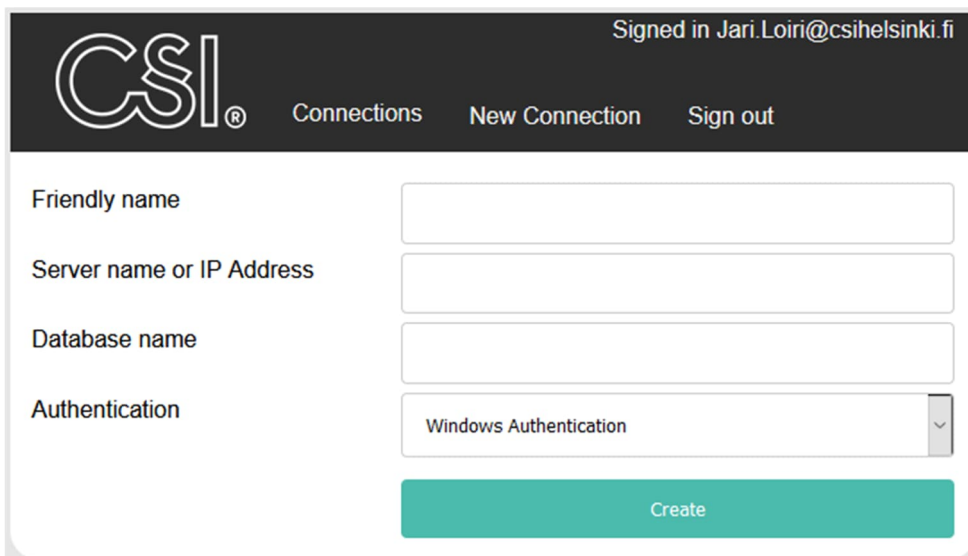

CSI® Connections New Connection Sign out

Friendly name: CSILakiMiesNet_JLo @ lap_jlo

Server name or IP address: LAP-JLO\SQLEXPRESS

Database name: CSILakiMiesNet_JLO

Authentication: Windows Authentication

Server name or IP Address:

Database name:

Authentication: Windows Authentication

Create

If SQL login is used on SQL Server level, choose Username and password, and add the SQL login as username and its password to the Password field. These are the same credentials that were used when connecting to the database for the first time after installation.
